

ADDING
INTELLIGENCE TO
SURVEILLANCE
TECHNOLOGY

The IRIS™ Digital Video System is a patented transaction-based image capture system designed specifically for the ATM industry. IRIS offered the first DVRs with “through-the-camera-lens” light monitoring. ATM lighting is automatically monitored and reported, giving you time to proactively correct a lighting situation.

Are your ATMs in light compliance?

Know automatically with the IRIS DVS System!

Among the many standard features of the IRIS Digital Video System is the ATM Nightwatch, patented “through the lens” motion sensing technology, and transaction-based image capture. IRIS integrates with most teller systems to read the data flow and captures images associated with an ATM or teller transaction.

Each system incorporates a proprietary authentication method that saves images in a non-changeable file, thereby providing the unimpeachable evidence needed to streamline an investigation, discovery process, or resolution of Regulation E claims. IRIS DVR systems meet all requirements of the ATM video recording laws.
