

**ADDING
INTELLIGENCE TO
SURVEILLANCE
TECHNOLOGY**

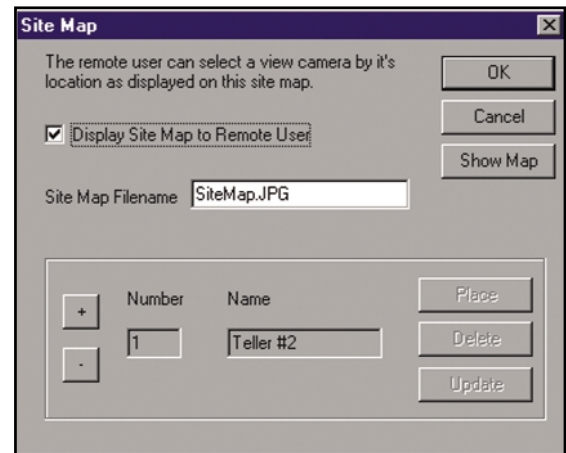

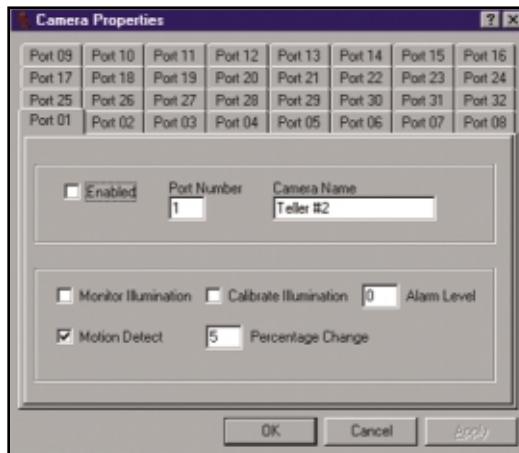

IRIS® Control Suite sets up, monitors the health of, and provides access to the IRIS Digital Video System (DVS) Servers. Control Suite is comprised of the following applications: **CONFIGURATOR** provides complete on-site or remote setup and programming functions for the IRIS DVS. **SERVICE MANAGER** communicates with the DVS site systems and polls them for health and maintenance issues, displays the current status of all monitored sites, reports systems that are online and the operational status of all systems. **ACCESS** identifies available IRIS DVS Servers and provides the System Administrator with the ability to manage user access to the IRIS DVS Servers on an enterprise-wide level.

CONTROL SUITE CONFIGURATOR

Configurator provides complete on-site or remote setup and programming functions for the IRIS DVS. All settings for camera timing, motion sensitivity, number of cameras and transaction types are done through Configurator. The systems are totally programmable while IRIS Server software is running. A site map with interactive camera locations may be updated at will; various transaction protocols may be selected, custom transaction protocols identified and sort characteristics chosen. Transaction information may be overlaid on the video image, in differing types of colors and backgrounds, and moved on the screen into various locations.

Key Features

- > Programming software for IRIS DVS
- > Communication through network, dial-up or on-site systems
- > Universal site map symbols indicate safe, vault, teller station, ATM, etc.
- > Customized camera naming for each location
- > Identification/verification of TCP/IP connections by transaction system
- > Reporting on disk usage and allocation for surveillance and transaction days are programmable
- > Timing, activation and camera selections for events are programmable
- > Image compression may be set for higher quality or more images
- > Lumen compensation control adjusts for gradual lighting changes
